# CRUCIBLE - deploy-day gates

Corrected for the built system: native ETH on Anvil, wallet-signed writes, a read-only API, no Postgres/Redis/KMS/pause. The pasted 50-gate USDC/Postgres/KMS checklist does not describe this deployment.

**THE ONE RULE: money moves only through the contract's pull ledger. Never settle by hand.**

## BEFORE MERGE

- [ ] **npm run verify:all** green: typecheck, 887 TS tests, 135 Foundry tests (131 run, 4 fork tests skipped without a mainnet RPC).
- [ ] **forge fmt --check**, forge test, coverage with **--ir-minimum**, and slither are green.
- [ ] The six invariants hold: balance = free stake + pending credit + escrow; escrow/pending never exceed balance; bond rule; terminal verdicts; tier range.
- [ ] Source-gated promotion: CI on the exact source commit is green; the ladder waits and refuses a red gate.
- [ ] gitleaks history scan is green; no .env, key JSON, or seed phrase is staged.
- [ ] next build and the dependency audit are green.

## CONTRACTS

- [ ] Native ETH only: no USDC, ERC-20, or EIP-2612 permit; createTrial is payable.
- [ ] 5% fee deducted from the agent, not added to the sponsor; 20% bond; 1% break stake.
- [ ] EIP-712 run signature binds trial, agent, run hash and deadline; high-s rejected; replay impossible; relay is permissionless.
- [ ] Self-break and self-claim both revert.
- [ ] Three Argus seats, 2-of-3 reveal; commits close on the 24h clock; 3-day timeout settles for the agent.
- [ ] Settlement runs once; payouts use the pull ledger; withdraw is nonReentrant and the UI exposes it.
- [ ] Reputation backfill is canonical and write-once per trial; an ERC-8004 outage never blocks a verdict.
- [ ] No pause and no upgrade, intentionally: an incident is a redeploy. The owner holds no funds.

## INDEXER AND API

- [ ] Cursor means "next block": head + 1 is caught up, only beyond it is a reset.
- [ ] /api/ready is true with lag 0 and no sync error; /health and /ready tell the same story.
- [ ] /stream serves one snapshot, is exempt from the read budget, and has a 200-stream ceiling.
- [ ] Per-IP rate limit, CORS allowlist, body cap, HTTPS/HSTS boot checks.
- [ ] The API holds no chain key and submits no transaction; auth origins are bound to configuration.
- [ ] DLQ and breaker state are visible; a real chain reset rebuilds instead of freezing.
- [ ] Mobile: 320px and 390px have no horizontal overflow; the hamburger opens the nav sheet; reduced motion is respected.

## DEPLOY

- [ ] CI builds web and API before the swap; the swap uses --no-deps; anvil keeps its chain.
- [ ] The host .env is never overwritten or synced.
- [ ] The shared edge is attached to crucible_default; the repair cron writes to /home/ubuntu/crucible-edge-attach.log; /api/health answers 200.
- [ ] assert-deployment.sh matches the fee, bond rule, committee, roles and money invariant.
- [ ] Public surface: site 200, /api/ready green, /hall rows quote real settlement and identity transactions.
- [ ] No immutable image tags or rollback button: rollback is git revert + redeploy; contracts cannot roll back.

## SECURITY AND OPERATIONS

- [ ] Key inventory reviewed: owner, treasury, keeper, Argus seats; the owner has no funds and cannot settle.
- [ ] Keeper passes are serialized; the breaker covers the RPC hop; the kill switch is outside the breaker.
- [ ] Voice key stays server-side; /voice/status is configured; VOICE_DISABLED=1 silences it without a deploy.
- [ ] CDP Sandbox profile: CDP_ENV=sandbox, CDP_ENABLE_LIVE=0; live is refused; a valid Sandbox Secret API Key with the Accounts scope is required.
- [ ] Incident: preserve the transaction and logs, do not settle manually, do not invent a pause.
- [ ] No secret in code or git history; the key JSON and .env are ignored.

## NOT APPLICABLE TO THIS DEPLOYMENT

USDC/Base, ERC-20/permit, 15% fee, Privy/ERC-4337, Ponder/Postgres, Redis/BullMQ, IPFS/Pinata, AWS KMS, Sentry/OpenTelemetry, pause/canary, outbox, idempotency keys on money POSTs, append-only-ledger-with-derived-balances, and a DB-to-chain reconciliation job. Writes are wallet-signed; the keeper and Warden are serial. Those gates describe a different product.

## STILL OPEN FOR PRODUCTION

No professional audit or formal verification; no pause or upgrade path; demo ETH keys; no KMS or epoch rotation; no immutable image/rollback path; no Sentry, OpenTelemetry, RED metrics or SLOs; no database reconciliation; no public transparency page, SBOM, ToS or sanctions checks; no chaos drill. CDP Sandbox is still blocked on a valid Sandbox key (the available keys answer 401).

Three gates that catch most outages here: the source-gated promotion, the head + 1 cursor rule, and the edge attachment with a writable repair log.
